

As organizations face tightening compliance mandates and growing data sensitivity, traditional monitoring methods have become unsustainable. Many teams still depend on manual log reviews or third-party alerting systems that require separate infrastructure and specialized support. These fragmented processes create inefficiency, slow down response times, and leave critical gaps in coverage.

## Silo Event Manager

Authentic8's integrated rules-based monitoring solution, Silo Event Manager, brings compliance automation directly into the Silo Admin Console. By embedding real-time event detection where users interact with content, it eliminates reliance on external systems while giving administrators precise control.

Event Manager enables administrators to define conditions, such as specific keywords or content attributes, and associate them with automated actions—logging events or triggering email alerts. This allows compliance teams to instantly detect sensitive activity across multiple data sources, including web content, URLs, and form submissions. Logs are automatically stored within Silo's secure infrastructure, complete with session, user, and egress metadata for rapid triage and audit readiness.

Advanced rule logic supports wildcards, Boolean operators, and multilingual text matching, allowing organizations to scale from simple alerts to sophisticated monitoring frameworks. Optional notifications ensure swift escalation, reducing time between event and response.

Future versions will extend these capabilities to include proactive enforcement—such as blocking downloads or restricting access—transforming Silo Event Manager from a monitoring tool into a comprehensive compliance enforcement platform.
